

SESSION KNOWLEDGE HANDOFF — for another AI

Date: 2026-06-04 (Sydney / AEST). Data through US session June 2–3, 2026. **What this is:** A complete transfer of everything vital worked out in one research session, so a second AI can continue without re-deriving it. Section 2 is the priority: findings we actually *discovered* this session (not generic knowledge).

0. HANDOFF PROMPT — paste this first

You're a markets + systems research assistant for a sophisticated independent operator in Sydney (UTC+10), Persian-speaking (respond in Farsi; give direct verdicts, no boilerplate disclaimers). He runs an **antifragile barbell**: ~80% safe core (BTC + yield stablecoins) / ~20% convex frontier satellites capped ~2% each, fractional-Kelly (~25% fraction). **Survival filter first**: assume most new tokens/microcaps are traps; edge = filtering, not picking; a coin you can't *exit* is worthless regardless of thesis (the "C64 trap"). 3-signal entry: network + holder + developer. He's also a CPU-miner of frontier coins (cheap-power edge). He thinks in regimes, bifurcations, antifragility, and sentiment↔price divergence. Treat everything below as established ground truth for this session and continue the hunt for emerging, asymmetric, *uncorrelated* setups. Separate "real/event-driven" from "beta to the risk-off tape," and flag fragile/falling-knife names explicitly rather than dressing them up as opportunities. This is analysis, not financial advice.

1. THE REGIME IN ONE LINE

Genuine **risk-off regime shift**: BTC >50% below its Oct-2025 ATH (~\$126k), fresh 1-year low ~\$62.6k. Cause is macro (inflation resurgence → Fed cuts priced out → strong USD), not crypto-internal. **Price has capitulated; social sentiment has not (~75%)** → a true bottom may not be in.

2. ★ NEW / NON-OBVIOUS FINDINGS WE DISCOVERED THIS SESSION

(These are the session's actual alpha — the things not obvious from general knowledge.)

1. **ABVX bounced +24% to \$90.15 the day after a ~-40% crash.** The Phase-3 maintenance "cancer signal" selloff (to ~\$78) was faded hard by the "overreaction/dip-buy" camp on day 2. The analyst reaction is *split*, not uniformly bearish — Jefferies cut to Hold (\$90) but **Citizens RAISED target to \$187**; even the bear target sits above the crash price. → The debate is "labeling overhang vs causal risk," and the market is actively re-pricing it intraday.
2. **River Tech (RIVER.OL) is a corpse, not a dip.** Despite being the #1 "Daily Mover" loser (-38.6%), it's in **court-supervised liquidation** — Oslo "Recovery Box" since Mar 20 2026, workforce laid off, bank account frozen, winding-up ordered. This is the cleanest live example of the survival-filter's purpose and maps exactly to the user's DMKPQ "Q-suffix / bankruptcy" pattern. **Lesson reinforced: Daily Movers / biggest-loser lists are structurally a magnet for the most fragile names.**
3. **The "frontier risk appetite is dead" signal is now measurable in leveraged ETFs.** On June 2–3, 2x **LONG** ETFs on quantum (RGTX), nuclear (OKLL), AI (SOUX, OKTG) fell -17% to -22%, while 2x **SHORT** quantum ETFs (RGTZ, QBTZ) turned green. This is a clean, real-time confirmation of the user's "frontier-risk sensor" thesis — speculative leverage is being flushed.
4. **BTC's on-chain "71k floor" narrative has already broken while sentiment stays optimistic.** LunarCrush BTC sentiment holds ~75% even though price (~\$62.6k) is *below* the widely-cited 71k on-chain demand floor. Divergence = capitulation likely not complete. **Watch sentiment breaking <65% as the capitulation tell.**
5. **Relative-strength leaders in the dump: ZEC** (Zcash — Multicoin Capital took a significant position, "cypherpunk/PoW/privacy" framing; aligns with the user's quantum-resistance/privacy thesis) and **INJ** (Injective — outperforming BTC, **clean 1.0 MC/FDV, zero scheduled unlocks**, which matches his unlock-aversion). Sector-level: Polkadot-eco and XRP-Ledger-eco flagged as largest gainers. **XLM** has a real catalyst (DTCC tokenization).
6. **CryptoQuant API pipeline — hard technical discoveries** (so the next AI/script doesn't repeat them):
 - The discovery endpoint's `parameters` field is a **dict, not a string** (broke naive `.lower()` parsing).
 - Catalog paths already include the `/v1/` prefix → base URL must be the bare host or you get a double- `/v1/ 404`.
 - **48 of 245 endpoints need special params**, by category: `stablecoin/*` and

`erc20/*` require a specific token (`usdt/usdc/...`); `*/price-ohlcv` requires a named exchange (`binance/coinbase...`), not `all_exchange`; `inter-entity-flows` need a named exchange; `mempool/*` and `status/entity-list` take **no time params**.

- Full pull result: **197/245 OK, ~70,659 rows**; a retry script with per-category param strategies recovers most of the 48.
 - **Coverage gap**: CryptoQuant only covers BTC/ETH/XRP/TRON/stablecoins/ERC-20 — **none of the user's frontier CPU-mined coins**. It's a BTC-macro / flow tool only.
 - **CryptoQuant's MCP is a local npm server, not a remote URL** → cannot be added in the mobile/web app's custom-connector slot; needs Claude Desktop/Code, or just keep using the script (equivalent).
7. **Operational: LunarCrush is currently flaky** (timeouts, dropped connections) and its **stock sector filter is unreliable** (a `bitcoin-miners` query returned RDDT, Nokia, SPY). Don't trust sector-filtered LunarCrush pulls without sanity-checking; prefer FMP for named equities.
-

3. ABVX (Abivax) — FULL CASE

- **What happened**: Phase-3 *maintenance* (44-wk) readout for obefazimod in ulcerative colitis. Efficacy best-in-class (~51% remission both doses vs 10.4% placebo, ~40% placebo-adjusted). But rare malignancies in the higher (50mg) arm — 1 prostate, 1 breast, 1 colonic dysplasia (investigators: unrelated, no clustering) + skin cancers (2 of 4 had prior history). → cancer-signal **overhang**.
 - **Price path**: ~\$129–132 (late May) → \$129.69 (Jun 1) → ~\$78 intraday (Jun 2, -40%) → **\$90.15 (+24%) Jun 3 bounce**.
 - **Analyst split (post-crash)**: Jefferies Hold \$90 (from \$160); MS OW \$132; Truist Buy \$135; **Citizens Outperform RAISED to \$187**.
 - **Survival filter**: PASSES — real drug, cash to Q4 2027, prior ~\$18B M&A interest (AstraZeneca/Lilly). NOT a trap.
 - **Verdict reached**: Thesis valid but *timing* poor at the crash (mid-session knife, imminent dilution — CEO said they'll raise after the data, slow overhang). Chose **reminders over entry**.
 - **Key derisk dates**: ~Jun 9 stabilization/raise check · **Oct 2026 full 48-wk dataset** · Q4 2026 NDA · mid-2027 Crohn's Ph2b.
-

4. eTORO “DAILY MOVERS” TEARDOWN (the losers)

RIVER.OL (liquidating — see §2.2) · ABVX/ABVX.PA (the real event — §3) · Sound Energy SOU.L (~£4M AIM nano-cap, dilution-prone) · HRTX (sub-\$1 micro-cap, violent swings, no clean catalyst). Takeaway: 4 of 5 rows are exactly what the survival filter exists to reject; only ABVX was a “real” event.

5. MARKET REGIME (3-day macro)

- Inflation resurgence (US-Iran conflict since Feb → oil spike). **June rate cut priced ~1.7%**; Fed on hold / possibly hawkish.
 - First FOMC under chair **Warsh, Jun 16–17** (~97% no-change priced — *tone* is the catalyst).
 - **USD strong** (DXY >100). **Gold** pulled back from Jan ATH but high (~\$4,700); **precious metals steady while crypto falls = selective de-risking**.
 - **Oil elevated** = the one fundamental tailwind (energy sector).
 - Crypto specifics: BTC dominance ~55–57%; **spot-BTC-ETF outflows ~\$2.97B/10 sessions** (one –\$1.42B day); ~\$1B liquidations after BTC broke \$73k (May 28). Orderbook spreads tight → orderly, not illiquid panic.
 - Next: **US jobs report ~Jun 5–6** → moves rate-cut odds → BTC.
 - Live (Crypto.com): BTC ~\$62,217 (–6.8%), ETH ~\$1,756 (–5.6%) — both AT day-lows.
-

6. EQUITY SIGNALS (Jun 2–3)

- **ABVX +24%** (bounce, §3). **NVTS +19%** (GaN/Al semis). Froth unwind (§2.3). **CODX –17%** (the user’s previously-flagged pump-and-dump still unwinding → trap validation). Biggest-loser list otherwise sub-\$1 microcap/SPAC junk.
-

7. CONNECTORS & DATA ACCESS (state at session end)

- **Working:** Crypto.com (live crypto quotes/candles), FMP (equity movers, analyst grades/targets, calendars, insider/13F/senate/SEC filings, crypto quotes), web search, + a downloaded CryptoQuant on-chain dataset (245 endpoints / ~70.6k rows).

- **Flaky:** LunarCrush (social sentiment/movers).
 - **Connected but untapped:** Aiera (events/filings/transcripts), IBKR.
 - **Recommended gaps to add:** unusual options-flow (equity early-warning), native on-chain + smart-money (Glassnode/Nansen/CryptoQuant-MCP via Desktop), DEX/new-listing screener (Dexscreener/Birdeye) for frontier coins, derivatives feed (funding/OI/liq), crypto news (CoinDesk).
 - **Best untapped pulls with current tools:** FMP `insiderTrades` + `form13F` (13D/G changes) + `senate` + `analyst` `historical-grades` (last-3-day rating changes); Aiera `upcoming-events` + `filings`.
-

8. REMINDERS SET THIS SESSION (Sydney time)

- Jun 9 09:00 — ABVX stabilization + raise check
 - Oct 1 — ABVX full 48-wk dataset (high priority)
 - Dec 1 — ABVX NDA filing
 - Jun 1 2027 — ABVX Crohn's Ph2b
 - Jun 6 09:00 — US jobs report (NFP) → BTC/macro reaction (feeds the existing FOMC reminder ladder: Jun 8 / Jun 13 / Jun 16–17 Warsh).
-

9. OPEN QUESTIONS TO PURSUE NEXT

1. Is BTC bottoming, or does the un-capitulated 75% sentiment signal another leg down? (sentiment <65%, ETF-flow reversal = tells)
2. Do ZEC/INJ hold relative strength if BTC makes new lows (real rotation vs lag)?
3. Which last-~3-months frontier/CPU-mineable coins survive the survival filter in this risk-off (expect most to fail)?
4. Is the ABVX +24% bounce a base or a dead-cat before the Oct derisk?
5. Energy = only fundamental tailwind — any survival-filter-passing asymmetric expression?
6. Recover the 48 CryptoQuant endpoints via the retry script; then run FMP `insider/13D/senate` + Aiera filings for 3-day early-warning.
