

# CPU Mining Quantum Resistance Project

Strategic Plan & Architecture — v0.1 Owner: Cordelia | Created: May 2026

---

## 1. Project Vision & Ideology

This project positions to benefit from the growing market narrative around quantum-resistant cryptocurrency. Whether the quantum threat materializes soon or remains distant, significant capital is already flowing into quantum-safe projects. The strategy is to capture value from this fear-driven trend while remaining hedged against actual quantum disruption.

**Core principles:**

- Quality over quantity — accumulate more of fundamentally strong coins, less of risky speculation
  - Long-term horizon — no withdrawals planned for 6–7 years; full reinvestment
  - Wide-range future possibility — cast a broad net across quantum-resistant and strong-cryptography projects
  - Automation at the highest level — AI-driven coin discovery, vetting, and mining switching
- 

## 2. Budget & Investment Profile

| Item                 | Detail                                                                                              |
|----------------------|-----------------------------------------------------------------------------------------------------|
| Monthly Contribution | AUD 2,000 – 3,000 (from external income)                                                            |
| Withdrawal Plan      | None for 6–7 years (full reinvestment)                                                              |
| Investment Horizon   | Long-term: 2–3+ years per coin position                                                             |
| Allocation Strategy  | Dynamic — split between hardware & coin purchases based on opportunity quality and timeline urgency |
|                      |                                                                                                     |

|                       |                                                        |
|-----------------------|--------------------------------------------------------|
| <b>Risk Tolerance</b> | Acceptable — losses on early-stage mining are expected |
|-----------------------|--------------------------------------------------------|

---

### 3. Hardware Inventory

| Hardware          | Quantity | Assigned Role                                                                  |
|-------------------|----------|--------------------------------------------------------------------------------|
| Orange Pi 5 Pro   | 17       | Primary mining cluster — early-stage quantum-resistant coins (Group One & Two) |
| FPGA Artix-7 200T | 4        | Specialized hashing / algorithm acceleration as needed                         |
| ESP32             | 130      | Bitcoin lottery mining (long-shot block discovery)                             |

*Note: Electricity and cooling are not constraints for this plan.*

---

### 4. Mining Strategy — Two-Group System

#### Group One — Discovery & Test Mining (1 week)

- Mines newly launched coins identified through weekly discovery
- Purpose: gather real performance data — hash rate, coin value movement, network stability, community engagement
- Decision point at end of week: promote to Group Two or abandon

#### Group Two — Long-Term Mining (1–2 months)

- Mines coins that passed Group One vetting and show strong fundamentals
- Goal: accumulate substantial holdings of proven quality coins
- Reviewed monthly for continued profitability and project health

#### Bitcoin Lottery Layer (ESP32 fleet)

- All 130 ESP32 boards run continuously hunting Bitcoin blocks
- Acknowledged extreme low probability — kept as background opportunity, not core strategy

---

## 5. Coin Vetting Criteria

Every coin candidate is evaluated in this priority order:

### Priority 1 — Science & Technology

- Quantum resistance design (lattice, hash-based, code-based, multivariate, etc.)
- Cryptographic soundness and whitepaper quality
- Transparency of source code and protocol design
- Peer review or recognition from credible cryptographers

### Priority 2 — Team & Influence

- Founder background and prior project history
- How the project launched — fair launch vs. premine concerns
- Developer activity and roadmap execution

### Priority 3 — Economic & Community Growth

- Tokenomics: total supply, emission schedule, distribution fairness
  - Community size and quality of engagement
  - Exchange listings and liquidity trajectory
  - Strategic partnerships or institutional interest
- 

## 6. Architecture Goals

The end-state system is fully autonomous coin discovery and mining.

- Orange Pi cluster automatically detects new coin launches and switches mining algorithms
- AI assistant performs deep web research, filters misinformation, and accounts for human bias and market manipulation
- Self-healing operation — minimal manual intervention required
- Quantum-resistant by design at every layer where feasible

- Architecture-first development — solidify the foundation before scaling hardware
- 

## 7. Operating Cadence

| Frequency       | Activity                                                                |
|-----------------|-------------------------------------------------------------------------|
| Weekly (Friday) | Coin discovery & vetting — present 3–5 candidates for Group One         |
| Weekly          | Group One performance review — promote or drop coins                    |
| Monthly         | Group Two evaluation & budget allocation review                         |
| Monthly         | Hardware procurement decisions based on mining performance data         |
| Quarterly       | Strategy retrospective — adjust criteria, group sizes, allocation rules |

---

## 8. Step Zero — Immediate Next Steps

1. Confirm baseline hardware setup and inventory locations
  2. Establish OS image and mining software stack for Orange Pi 5 Pro cluster
  3. Establish minimal Bitcoin lottery firmware for ESP32 fleet
  4. Define data pipeline for coin discovery — sources include: CoinGecko new listings, DEX scanners, GitHub trending, Reddit/Discord signals, quantum-crypto research feeds
  5. Run first weekly coin discovery cycle and select Group One starters
  6. Begin first month's budget allocation after seeing initial Group One performance
- 

## 9. Open Questions to Resolve

- Where will the AI assistant orchestration run — dedicated Orange Pi node, or separate always-on box?
- Build coin-discovery AI from scratch or integrate existing APIs/data feeds first, then layer custom intelligence?
- Which mining pools or solo-mining setup for early-stage coins?

- Cold storage strategy for accumulated coins (hardware wallet, paper, multi-sig)?
- Operational security — wallet separation between mining, holding, and trading?

---
