

Context Handoff Document — Armin's Investment, Mining & Market Strategy

Date prepared: 11 June 2026 **Purpose:** Full context transfer to another AI assistant covering investment portfolio, CPU mining operation, and current market analysis decisions.

1. OPERATOR PROFILE

Name: Armin **Location:** Sydney, Australia **Language:** Conducts most conversations in Farsi (Persian) **Background:** Independent operator running three parallel tracks: painting business (cash engine), CPU-frontier crypto mining (long-term convex position), and active investment portfolio (~A\$4k).

Cognitive frameworks he applies consistently:

- Nonlinear dynamics, bifurcation theory
- Taleb-style antifragility
- Barbell strategy: 80% safe core / 20% frontier satellite (currently inverted — see Section 2)
- Fractional Kelly at 25% fraction, 2% hard cap per speculative position
- Survival filter as the primary gate before any allocation
- Idiosyncratic binary events as preferred uncorrelated edge

Background interests feeding into his investment thesis: quantum physics, consciousness research, philosophy of mind.

2. INVESTMENT PORTFOLIO POSTURE (mid-2026)

Total size: ~A\$4,000 **Cash position:** ~13% (~\$2,000+ dry powder explicitly identified as "armed patience") **Structural issue identified June 2026:** Portfolio is inverted — ~86% deployed into high-beta assets with no safe 80% core. Opposite of stated antifragile barbell.

Holdings:

- **eToro equities:** CRBP, NUVB, STRO, PLAB, ZS, AI-Revolution Smart Portfolio, SpaceTech Smart Portfolio
- **Crypto:** WLD, BDX, XRP, SOL, HYPE, swarms
- **Recent loss:** DMKPQ went to near-zero (bankruptcy)

Key catalysts being tracked:

- **CELC** wild-type PDUFA: 17 July 2026 — cohort-mispricing thesis, \$400M debt raise removed dilution risk
- **STRO** Phase 1 readout: mid-2026 — plan is trim part / keep runner
- **SpaceTech Smart Portfolio:** reduce in steps on relief bounce, no averaging down, cannot trim by name
- **Iran conflict** geopolitical/market implications: extensive scenario modeling done across ceasefire dynamics, leadership succession, macro spillovers

Dry powder deployment trigger ("washout trigger"):

1. BTC sentiment into 40s
2. contributors_active rolls over
3. first price higher-low
4. ideally post-FOMC Always deploy in tranches.

Execution principles (firm rules):

- No break-even anchoring
- Sell to redeploy, not to escape
- Rule/trigger-based execution over daily watching
- Survival quality $\neq$ stock return in high-rate regime
- Idiosyncratic binary events are preferred high-risk edge
- Already biotech-heavy — avoid adding more correlated biotech

Highest-conviction forming thesis: Quantum/PQC convergence (fits physics background + mining edge). **Conviction #2:** Rare earths / critical minerals (Pentagon 2027 deadline, ASX access from Sydney).

3. CPU MINING OPERATION

Strategy: Mine coins launched in last 3 months only (NOT established coins). Survival potential is the primary criterion. Quantum resistance is a bonus, not required. Goal: heavy accumulation and holding.

Hardware fleet:

- 16–50× Orange Pi 5 boards (primary workhorse — Yespower/RandomX algorithms)
- 50–200× ESP32 microcontrollers
- 2× QMTECH Artix-7 200T + 1× Artix-7 100T FPGAs — **PARKED** (2010-era tech, can't compete with modern ASICs, Nexus tooling frozen since 2022)

Structural edge: Electricity cost under \$0.05/kWh or solar — enables mining coins uneconomical for others.

Available build time: 10–20 hours/week **Mining capital strategy:** Kept strictly separate from investment capital.

Tooling built:

- **Coin Hunter Bot:** 13-file theoretical design complete (CORE_PRINCIPLES, orchestrator/tier prompts, output schema, adversarial defense, handoff prompt). Python harness + tactics.yaml implementation PENDING — revisit later.
- **SENTINEL monitoring bot:** Bilingual Persian/English Telegram signals, NEVER auto-trades. Built and refined.
- **C64 veto / "exit feasibility" module:** Identified as missing in framework — coins easy to accumulate but impossible to exit are a confirmed failure mode (learned via C64 Chain experience).
- **Telegram self-tracking bot, decision loop with 24-hour cooldown queue, and "Trap Detector" HTML tool** encoding forensic pump-and-dump signals.

Framework formalization:

- 3-signal entry: network + holder + developer
- Staged entry
- Survival filter as primary gate

4. CURRENT MARKET ANALYSIS — RECENT DECISION

CONTEXT

Macro signals being weighed (June 2026):

Quantum threat timeline acceleration:

- Google Quantum AI research (March 2026): breaking Bitcoin ECDSA signatures requires ~10–20× fewer quantum resources than previously estimated. Under 500,000 physical qubits could recover a private key in minutes.
- US NSA CNSA 2.0 mandates all new national security systems be quantum-safe by January 2027.
- 2026 designated “Year of Quantum Security” by FBI, NIST, CISA.
- Armin’s working assumption: Q-Day late 2027. Even if actual attack doesn’t happen, regulatory panic January 2027 is enough to trigger PQC repricing wave.

Crypto market sentiment context:

- Fear & Greed Index currently ~45 (neutral, leaning fear)
- BTC trading \$78.7k–\$80.5k range after hot inflation data
- Recent \$109M long liquidations
- Total market cap ~\$2.73T (down 1.4%)

Two-strategy CPU-mineable sub-\$1 coin analysis just completed:

STRATEGY A — Quantum-resistant insurance picks:

1. **Dilithion (DIL)** — TOP PICK

- Mainnet launched January 2026 (fits <3-month rule loosely; very fresh)
- RandomX PoW + Verifiable Delay Functions (VDF)
- 21M total supply, 50 DIL/block initial reward, 4-min block time, halving every 210K blocks (~1.6 years) — Bitcoin clone 2.5× faster
- 2% dev contribution (NOT pre-mine), bridge to Base/Coinbase L2
- Named after CRYSTALS-Dilithium PQC algorithm
- CPU-mineable with same XMRig used for Monero → directly runs on Orange Pi 5 fleet
-  **CRITICAL WARNING:** Whitepaper explicitly states “EXPERIMENTAL software

developed with AI assistance and NOT professionally audited.” This is a red flag against survival filter.

2. Salvium (SAL)

- Price ~\$0.0136, market cap ~\$742K, rank ~#3389 on CoinGecko
- L1 PoW, CryptoNote-based privacy, 20% block reward staking
- RandomX variant — same XMRig rig as Monero
- Compliant privacy + DeFi-ready roadmap
- Not pure PQC yet, but if team adopts Dilithium/Falcon, could see major repricing

STRATEGY B — Non-quantum frontier picks:

3. Xelis (XEL)

- Mainnet launch 20 April 2024 (older than <3-month rule but justified as “balanced frontier”)
- Price ~\$0.42, market cap ~\$2.18M, +28.9% in last 7 days
- L1 in Rust, BlockDAG + homomorphic encryption + smart contracts
- XelisHash v3, network hashrate ~182 Mh/s, block reward 1.0128 XEL
- ATH was \$12.71 (now \$0.42) — ~30× downside-to-recovery potential

4. Wownero (WOW)

- Price ~\$0.035 (May 2026 data)
- Monero fork using RandomWOW (lite RandomX, 1MB scratchpad)
- 184M capped supply, no pre-mine, no ICO, no dev tax — fair launch
-  **CRITICAL WARNING:** Trading halted ~22 days on CoinGecko, 24h volume near zero. Exit liquidity is a major risk — directly hits the C64 veto module Armin identified.

Proposed allocation framework (from risky pocket):

- 40% DIL (highest asymmetric upside)
- 25% XEL (better liquidity)
- 20% SAL (covered call on mining infrastructure)
- 15% WOW (pure tail-risk bet)

With Kelly fractional 25% + 2% hard cap, this translates to roughly:

- DIL: 0.8% of total
- XEL: 0.5%
- SAL: 0.4%
- WOW: 0.3%

Mining tilt note: Because of <\$0.05/kWh electricity edge, mining accumulation > buying for DIL and SAL specifically — same XMRig rig can switch between Monero, DIL, and SAL.

5. ACTIVE REMINDERS / TRACKING SYSTEM

iOS Reminders list ID: F23319E0-3683-4383-A9E9-C23BB08284F9

- Covers all major portfolio catalysts (CELC PDUFA, STRO readout, SpaceTech reductions)
 - Tool quirks discovered: batch creation via `reminderLists` array works reliably; post-creation verification via `reminder_search_v0` more reliable than trusting API response; recurrence requires BOTH `rrule` string and `humanReadableFrequency`; tool sometimes times out silently and requires retry.
-

6. CONVERSATIONAL/PERSONAL NOTES FOR HANDOFF

- Armin prefers Farsi for most interactions but is fully comfortable in English for technical content
- He has expressed wellbeing concerns in past conversations — partner is currently based in Iran; he has been actively working on in-person social connections in Sydney after a period of isolation
- Closely tracking Iran conflict for both personal reasons and market impact
- Values rule-based discipline over emotional reactions
- Treats Claude as a serious thinking partner — expects pushback when reasoning is weak, not flattery
- Has a worldbuilding project ("جهان هم‌فاز" / Coherent World, also "Fusion World" / جهان فیوژن) tied to quantum mechanics — physics and finance threads intertwine in his thinking

7. OPEN ITEMS / WHERE HE LEFT OFF

The most recent decision he was weighing at the time of this handoff:

- Whether to do deep-dive Orchestrator-style nine-section analysis on each of the four coins (DIL, SAL, XEL, WOW)
 - Or to write Kelly-sizing code for the four-coin sub-portfolio
 - Both options were offered; no choice locked in yet
-

8. CRITICAL CAVEATS FOR THE RECEIVING AI

1. **Dilithion has NOT been audited** — the whitepaper itself flags this. Don't recommend allocation without re-confirming this.
2. **Wownero has near-zero liquidity** — trading effectively halted. Position sizing must reflect that exits may not be possible.
3. **Q-Day late 2027 is Armin's working assumption, NOT consensus** — most expert estimates put cryptographically-relevant quantum computers $\geq 10-15$ years away. The thesis works either way (regulatory panic alone is sufficient catalyst) but the receiving AI should not adopt the 2027 assumption uncritically.
4. **All four coins have very limited liquidity** — every survival-filter check Armin built must be re-run before any real capital is deployed.
5. **Investment capital and mining capital are SEPARATE** — do not blur these in recommendations. Mining is for accumulation; investing is for redeployment of dry powder against binary catalysts.
6. **Don't recommend more biotech exposure** — portfolio is already biotech-heavy.
7. Armin pushes back hard when an AI assistant pattern-matches or is sycophantic. Be direct.
